SUMMARY

AI engineer who builds the checks, routing and guardrails that make AI agents cheap and trustworthy. 7+ years shipping production TypeScript and Node. Built an agent kit for a client's engineering team that passed its security review, and cut model cost on my own systems by routing on free checks and handing the model exact context instead of letting it search.

SKILLS

- **AI systems:** coding-agent rollout (Claude Code, Cursor, Codex), model routing and cascades, evals as gates, context design, sandboxed agent execution, PII and egress controls, AI spend measurement
- **Frontend:** TypeScript, JavaScript, React, Angular, HTML, CSS
- **Backend:** Node.js, Express, NestJS, Java, Redis
- **Data:** PostgreSQL, MongoDB, MySQL, Prisma
- **Infrastructure:** Docker, AWS, NGINX, CI/CD (Jenkins, GoCD)

EXPERIENCE

Software Engineer Consultant - New Visions for Public Schools

Contract via Summit Staffing Agency | Sep 2025-Present

Full-stack engineer on a multi-tenant student-data platform for a major urban school district. About 100 PRs across about 75 tickets, with strict per-district data isolation.

- Built an AI agent kit so every engineer on the team can use coding agents safely: tickets pass a PII filter before any model sees them, agents run in containers and never on the host, and every result passes checks and guards for tests, databases, PII and outbound calls. Ran its security review myself and hardened what the review found.
- Rebuilt the team's daily AI workflow: replaced repeated model-driven steps (log analysis, version-control work, approvals) with deterministic scripts and stored state, cutting token use and raising shipped output over several months.
- Found and fixed two agent-container gaps: dev databases open to the shared network with no passwords, and shell history (holding credentials) mounted where the agent could read it.
- Designed and built an electronic parental-consent system end to end in about two weeks: signing-token data model, about 15 server routes, and a public signing endpoint that keeps per-district isolation without a logged-in user. Passed legal and security review.
- Owned the platform's largest recent feature, a configuration-driven student-profile system: wrote the frontend/backend contract and replaced a hard-coded switch with per-district configuration.

Oct 2024-Sep 2025: independent job search after Marin Software's shutdown; continued systems work (below).

Software Engineer - Marin Software

Remote | Oct 2022-Oct 2024 (company ceased operations)

- Built a rule-driven JSON-transformation service (NestJS, TypeScript) that cut code changes for new integrations by 90% and deployments by nearly 100%; non-engineers managed integrations.
- Built cost/revenue ingestion middleware (Node.js, MongoDB) and onboarding tooling that cut customer onboarding time by 85%.
- Built and maintained 4 ad-platform API integrations (NestJS, REST, OAuth); automated CI/CD with Jenkins, GoCD and Jest.
- Owned a live outage during a major customer's go-live and shipped the fix without escalating.

Software Engineer - Herff Jones

Indianapolis, IN (Hybrid) | Jul 2019-Sep 2022

- Resolved 300+ production issues in the first year on a customer-facing legacy platform.
- Documented an undocumented Spring Boot + AngularJS system for the whole team; wrote 20+ technical documents and led 7 company-wide presentations.

INDEPENDENT AI SYSTEMS WORK

hub - a personal platform where AI agents do real work inside checks I write. Measured on real changes, priced at Claude Opus API rates (small samples):

- **Model cascade:** the cheap model tries first and a free check decides when to move up. About $2.50 against $3.93 on the top model alone.
- **Code-gathered context:** code finds the exact place to change, then one model call makes it. Small changes went from $1.43 to $0.04 and from $1.49 to $0.47.
- **Small checked steps:** a large change split into 4 steps cost $0.67-$1.79, against $7.77 in one call.
- **Design-edit tool:** points the model at the exact code behind a styling change. Searches per change fell from about 14 to about 4; cost per change from about $2.50 to $0.85.
- **Token burners to scripts:** one background job went from 103 model calls every 15 minutes to 3.
- **model-egress:** one door for all hosted-model traffic; hides personal data and refuses what it cannot make safe.

EARLIER EXPERIENCE

Operations Team Lead, Hipstr Photo Activations (Feb-Jul 2019) | Web Developer, Everlasting Wardrobe (May 2018-Feb 2019) | professional musical theatre (2012-2017).

EDUCATION

BFA in Musical Theatre, University of Michigan. Software development, data structures and algorithms, and applied math coursework through the University of Pennsylvania, University of San Diego, and SkillCrush Coding School.
